### **BINOMIAL THEOREM**

#### 1. BINOMIAL EXPRESSION:

Any algebraic expression which contains two dissimilar terms is called binomial expression.

For example : 
$$x - y$$
,  $xy + \frac{1}{x}$ ,  $\frac{1}{z} - 1$ ,  $\frac{1}{(x - y)^{1/3}} + 3$  etc.

#### 2. **BINOMIAL THEOREM:**

The formula by which any positive integral power of a binomial expression can be expanded in the form of a series is known as **BINOMIAL THEOREM.** 

If  $x, y \in R$  and  $n \in N$ , then:

$$(x + y)^{n} = {^{n}C_{0}}x^{n} + {^{n}C_{1}}x^{n-1}y + {^{n}C_{2}}x^{n-2}y^{2} + \dots + {^{n}C_{r}}x^{n-r}y^{r} + \dots + {^{n}C_{n}}y^{n} = \sum_{r=0}^{n} {^{n}C_{r}}x^{n-r}y^{r}$$

This theorem can be proved by induction.

#### **Observations:**

- (a) The number of terms in the expansion is (n+1) i.e. one more than the index.
- (b) The sum of the indices of x & y in each term is n.
- (c) The binomial coefficients of the terms ( ${}^{n}C_{0}$ ,  ${}^{n}C_{1}$ ....) equidistant from the beginning and the end are equal. i.e.  ${}^{n}C_{r} = {}^{n}C_{r-1}$
- (d) Symbol  ${}^{n}C_{r}$  can also be denoted by  $\binom{n}{r}$ , C(n, r) or  $A_{r}^{n}$ .

#### **Some important expansions:**

$$(1 + x)^n = {}^nC_0 + {}^nC_1x + {}^nC_2x^2 + \dots + {}^nC_nx^n.$$

(ii) 
$$(1 - x)^n = {}^nC_0 - {}^nC_1x + {}^nC_2x^2 + \dots + (-1)^n \cdot {}^nC_nx^n$$
.

**Note:** The coefficient of  $x^r$  in  $(1 + x)^n = {}^nC_r$  & that in  $(1-x)^n = (-1)^r$   ${}^nC_r$

### Pascal's triangle:

Pascal's triangle

- (i) **Pascal's triangle -** A triangular arrangement of numbers as shown. The numbers give the binomial coefficients for the expansion of  $(x + y)^n$ . The first row is for n = 0, the second for n = 1, etc. Each row has 1 as its first and last number. Other numbers are generated by adding the two numbers immediately to the left and right in the row above.
- (ii) Pascal triangle is formed by binomial coefficient.
- (iii) The number of terms in the expansion of  $(x+y)^n$  is (n+1) i.e. one more than the index.
- (iv) The sum of the indices of x & y in each term is n.
- (v) Power of first variable (x) decreases while of second variable (y) increases.
- (vi) Binomial coefficients are also called combinatorial coefficients.
- (vii) Binomial coefficients of the terms equidistant from the begining and end are equal.
- (viii)  $r^{th}$  term from the beginning in the expansion of  $(x + y)^n$  is same as  $r^{th}$  term from end in the expansion of  $(y + x)^n$ .
- (ix)  $r^{th}$  term from the end in  $(x + y)^n$  is  $(n r + 2)^{th}$  term from the beginning.

#### 3. IMPORTANT TERMS IN THE BINOMIAL EXPANSION:

(a) General term: The general term or the  $(r+1)^{th}$  term in the expansion of  $(x+y)^n$  is given by  $T_{r+1} = {}^{n}C_{r} x^{n-r} y^{r}$ 

**Illustration 4:** Find: (a) The coefficient of  $x^7$  in the expansion of  $\left(ax^2 + \frac{1}{bx}\right)^{11}$ 

(b) The coefficient of 
$$x^{-7}$$
 in the expansion of  $\left(ax^2 + \frac{1}{bx}\right)^{11}$ 

Also, find the relation between a and b, so that these coefficients are equal.

## **Solution:**

In the expansion of  $\left(ax^2 + \frac{1}{hv}\right)^{11}$ , the general term is: (a)

$$T_{r+1} = {}^{11}C_r(ax^2)^{11-r} \left(\frac{1}{bx}\right)^r = {}^{11}C_r.\frac{a^{11-r}}{b^r}.x^{22-3r}$$

putting 
$$22 - 3r = 7$$
  
 $\therefore 3r = 15 \implies r = 5$ 

$$T_6 = {}^{11}C_5 \frac{a^6}{b^5} \cdot x^7$$

Hence the coefficient of  $x^7$  in  $\left(ax^2 + \frac{1}{bx}\right)^{11}$  is  ${}^{11}C_5a^6b^{-5}$ .

Note that binomial coefficient of sixth term is  ${}^{11}C_5$ .

In the expansion of  $\left(ax - \frac{1}{bx^2}\right)^{11}$ , general term is: (b)

$$T_{r+1} = {}^{11}C_r(ax)^{11-r} \left(\frac{-1}{bx^2}\right)^r = (-1)^{r+1}C_r \frac{a^{11-r}}{b^r}.x^{11-3r}$$

putting 11 - 3r = -7

$$\therefore 3r = 18 \implies r = 6$$

$$T_7 = (-1)^6 \cdot {}^{11}C_6 \frac{a^5}{b^6} \cdot x^{-7}$$

Hence the coefficient of  $x^{-7}$  in  $\left(ax - \frac{1}{bx^2}\right)^{11}$  is  ${}^{11}C_6a^5b^{-6}$ .

Also given:

Coefficient of  $x^7$  in  $\left(ax^2 + \frac{1}{bx}\right)^{11}$  = coefficient of  $x^{-7}$  in  $\left(ax - \frac{1}{bx^2}\right)^{11}$ 

$$\Rightarrow$$
  ${}^{11}C_5 a^6 b^{-5} = {}^{11}C_6 a^5 b^{-6}$ 

$$\Rightarrow {}^{11}C_5 a^6 b^{-5} = {}^{11}C_6 a^5 b^{-6}$$
  
\Rightarrow ab = 1 (::  ${}^{11}C_5 = {}^{11}C_6$ )

which is the required relation between a and b.

## Illustration 5:

Find the number of rational terms in the expansion of  $(9^{1/4} + 8^{1/6})^{1000}$ .

The general term in the expansion of  $(9^{1/4} + 8^{1/6})^{1000}$  is **Solution:** 

$$T_{r+1} = {}^{1000}C_r \left(9^{\frac{1}{4}}\right)^{1000-r} \left(8^{\frac{1}{6}}\right)^r = {}^{1000}C_r 3^{\frac{1000-r}{2}} 2^{\frac{r}{2}}$$

The above term will be rational if exponents of 3 and 2 are integers

It means  $\frac{1000-r}{2}$  and  $\frac{r}{2}$  must be integers

The possible set of values of r is  $\{0, 2, 4, \dots, 1000\}$ 

Hence, number of rational terms is 501

#### **(b)** Middle term:

The middle term(s) in the expansion of  $(x + y)^n$  is (are):

- If n is even, there is only one middle term which is given by  $T_{(n+2)/2} = {}^{n}C_{n/2}$ .  $x^{n/2}$ .  $y^{n/2}$ **(i)**
- If n is odd, there are two middle terms which are  $T_{(n+1)/2}$  &  $T_{[(n+1)/2]+1}$ (ii)

## ALLEN

### **Important Note:**

Middle term has greatest binomial coefficient and if there are 2 middle terms their coefficients will be equal.

$$\Rightarrow \quad {^{n}C_{r}} \text{ will be maximum} \qquad \qquad When \ r = \frac{n}{2} \text{ if n is even} \\ \text{When } r = \frac{n-1}{2} \text{ or } \frac{n+1}{2} \text{ if n is odd}$$

 $\Rightarrow$  The term containing greatest binomial coefficient will be middle term in the expansion of  $(1 + x)^n$ 

**Illustration 6:** Find the middle term in the expansion of 
$$\left(3x - \frac{x^3}{6}\right)^9$$

**Solution:** The number of terms in the expansion of  $\left(3x - \frac{x^3}{6}\right)^9$  is 10 (even). So there are two middle terms.

i.e. 
$$\left(\frac{9+1}{2}\right)^{th}$$
 and  $\left(\frac{9+3}{2}\right)^{th}$  are two middle terms. They are given by  $T_5$  and  $T_6$ 

$$T_5 = T_{4+1} = {}^{9}C_{4}(3x)^{5} \left(-\frac{x^{3}}{6}\right)^{4} = {}^{9}C_{4}3^{5}x^{5}. \quad \frac{x^{12}}{6^{4}} = \frac{9 \cdot 8 \cdot 7 \cdot 6}{1 \cdot 2 \cdot 3 \cdot 4} \cdot \frac{3^{5}}{2^{4} \cdot 3^{4}} x^{17} = \frac{189}{8} x^{17}$$

and 
$$T_6 = T_{5+1} = {}^9C_5(3x)^4 \left(-\frac{x^3}{6}\right)^5 = -{}^9C_43^4 \cdot x^4 \cdot \frac{x^{15}}{6^5} = \frac{-9 \cdot 8 \cdot 7 \cdot 6}{1 \cdot 2 \cdot 3 \cdot 4} \cdot \frac{3^4}{2^5 \cdot 3^5} x^{19} = -\frac{21}{16} x^{19}$$
 Ans.

### (c) Term independent of x:

Term independent of x does not contain x; Hence find the value of r for which the exponent of x is zero.

**Illustration 7:** The term independent of x in 
$$\left[\sqrt{\frac{x}{3}} + \sqrt{\left(\frac{3}{2x^2}\right)}\right]^{10}$$
 is -

(B) 
$$\frac{5}{12}$$

$$(C)^{10}C_1$$

**Solution :** General term in the expansion is

$$^{10}C_r \left(\frac{x}{3}\right)^{\frac{r}{2}} \left(\frac{3}{2x^2}\right)^{\frac{10-r}{2}} = {^{10}C_r}x^{\frac{3r}{2}-10} \cdot \frac{3^{5-r}}{2^{\frac{10-r}{2}}}$$
 For constant term,  $\frac{3r}{2} = 10 \Rightarrow r = \frac{20}{3}$ 

which is not an integer. Therefore, there will be no constant term.

### (d) Numerically greatest term:

Let numerically greatest term in the expansion of  $(a + b)^n$  be  $T_{r+1}$ .

$$\Rightarrow \quad \begin{cases} \mid T_{r+1} \mid \geq \left| T_r \right| \\ \left| T_{r+1} \right| \geq \left| T_{r+2} \right| \end{cases} \text{ where } T_{r+1} = {}^nC_r a^{n-r} b^r$$

Solving above inequalities we get  $\frac{n+1}{1+\left|\frac{a}{b}\right|}-1 \le r \le \frac{n+1}{1+\left|\frac{a}{b}\right|}$ 

Case I: When  $\frac{n+1}{1+\left|\frac{a}{b}\right|}$  is an integer equal to m, then  $T_m$  and  $T_{m+1}$  will be numerically greatest term

Case II: When  $\frac{n+1}{1+\left|\frac{a}{b}\right|}$  is not an integer and its integral part is m, then  $T_{m+1}$  will be the numerically greatest term.

**Illustration 8:** Find numerically greatest term in the expansion of  $(3-5x)^{11}$  when  $x = \frac{1}{5}$ 

Solution:

Using 
$$\frac{n+1}{1+\left|\frac{a}{b}\right|}-1 \le r \le \frac{n+1}{1+\left|\frac{a}{b}\right|}$$

$$\frac{11+1}{1+\left|\frac{3}{-5x}\right|} - 1 \le r \le \frac{11+1}{1+\left|\frac{3}{-5x}\right|}$$

solving we get  $2 \le r \le 3$ 

$$\therefore$$
 r = 2, 3

so, the greatest terms are  $T_{2+1}$  and  $T_{3+1}$ .

 $\therefore$  Greatest term (when r = 2)

$$T_3 = {}^{11}C_2.3^9 (-5x)^2 = 55.3^9 = T_4$$

From above we say that the value of both greatest terms are equal.

also, we have

$$(x + 1)^n = C_0 x^n + C_1 x^{n-1} + C_2 x^{n-2} + \dots + C_n$$

#### 5. MULTINOMIAL THEOREM:

Using binomial theorem, we have  $(x + a)^n = \sum_{r=0}^{n} {}^{n}C_r x^{n-r} a^r$ ,  $n \in \mathbb{N}$ 

$$= \sum_{r=0}^{n} \frac{n!}{(n-r)!r!} x^{n-r} a^{r} = \sum_{r+s=n} \frac{n!}{r!s!} x^{s} a^{r} , \text{ where } s+r=n$$

This result can be generalized in the following form.

$$(x_1 + x_2 + \dots + x_k)^n = \sum_{r_1 + r_2 + \dots + r_k = n} \frac{n!}{r_1! r_2! \dots r_k!} x_1^{r_1} x_2^{r_2} \dots x_k^{r_k}$$

The general term in the above expansion  $\frac{n!}{r_1!r_2!r_3!....r_k!}.x_1^{r_1}x_2^{r_2}x_3^{r_3}.....x_k^{r_k}$ 

The number of terms in the above expansion is equal to the number of non-negative integral solution of the equation  $r_1 + r_2 + \dots + r_k = n$  because each solution of this equation gives a term in the above expansion. The number of such solutions is  ${}^{n+k-1}C_{k-1}$

 Ans.

**Illustration 21:** Find the coefficient of  $x^5$  in the expansion of  $(2 - x + 3x^2)^6$ .

**Solution:** The general term in the expansion of 
$$(2-x+3x^2)^6 = \frac{6!}{r!s!t!} 2^r (-x)^s (3x^2)^t$$
,

where r + s + t = 6.

$$= \frac{6!}{r!s!t!} 2^{r} \times (-1)^{s} \times (3)^{t} \times x^{s+2t}$$

For the coefficient of  $x^5$ , we must have s + 2t = 5.

But, 
$$r + s + t = 6$$
,

$$\therefore$$
 s = 5 - 2t and r = 1 + t, where  $0 \le r$ , s, t  $\le 6$ .

Now 
$$t = 0 \implies r = 1$$
,  $s = 5$ .

$$t=1 \implies r=2, s=3.$$

$$t=2 \implies r=3, s=1.$$

Thus, there are three terms containing x<sup>5</sup> and coefficient of x<sup>5</sup>

$$= \frac{6!}{1! \ 5! \ 0!} \times 2^{1} \times (-1)^{5} \times 3^{0} + \frac{6!}{2! \ 3! \ 1!} \times 2^{2} \times (-1)^{3} \times 3^{1} + \frac{6!}{3! \ 1! \ 2!} \times 2^{3} \times (-1)^{1} \times 3^{2}$$

**Solution:** (a) We have

$$(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$$
 ....(A)

$$\therefore \qquad \left(1 + \frac{1}{x} + \frac{1}{x^2}\right)^n = \sum_{r=0}^{2n} a_r \left(\frac{1}{x}\right)^r$$

$$\Rightarrow$$
  $(x^2 + x + 1)^n = \sum_{r=0}^{2n} a_r x^{2n-r}$ 

$$\Rightarrow \sum_{r=0}^{2n} a_r x^r = \sum_{r=0}^{2n} a_r x^{2n-r}$$
 {Using (A)}

Equating the coefficient of  $x^{2n-r}$  on both sides, we get

$$a_{2n-r} = a_r$$
 for  $0 \le r \le 2n$ .

Hence 
$$a_r = a_{2n-r}$$

But  $a_r = a_{2n-r}$  for  $0 \le r \le 2n$ 

∴ series (1) reduces to

$$2(a_0 + a_1 + a_2 + \dots + a_{n-1}) + a_n = 3^n$$

(A) 
$$20^{2n+1}$$

(D) 
$$40^{2n+1}$$

Solution:

Since 
$$(6\sqrt{6} + 14)^{2n+1} = [N] + F$$

Let us assume that  $f = (6\sqrt{6} - 14)^{2n+1}$ ; where  $0 \le f < 1$ .

Now, [N] + F - f = 
$$(6\sqrt{6} + 14)^{2n+1} - (6\sqrt{6} - 14)^{2n+1}$$

$$=2\left[\frac{2n+1}{2}C_{1}\left(6\sqrt{6}\right)^{2n}\left(14\right)+\frac{2n+1}{2}C_{3}\left(6\sqrt{6}\right)^{2n-2}\left(14\right)^{3}+...\right]$$

 $\Rightarrow$  [N] + F – f = even integer.

Now 0 < F < 1 and 0 < f < 1

so -1 < F - f < 1 and F - f is an integer so it can only be zero

Thus NF = 
$$(6\sqrt{6} + 14)^{2n+1} (6\sqrt{6} - 14)^{2n+1} = 20^{2n+1}$$

**Illustration 25:** Prove that  $2222^{5555} + 5555^{2222}$  is divisible by 7.

**Solution:** When 2222 is divided by 7 it leaves a remainder 3.

So adding & subtracting 3<sup>5555</sup>, we get:

$$E = \underbrace{2222^{5555} - 3^{5555}}_{E_1} + \underbrace{3^{5555} + 5555^{2222}}_{E_2}$$

 $(: x^n - a^n \text{ is divisible by } x - a)$ 

For  $E_2$ : 5555 when devided by 7 leaves remainder 4.

So adding and subtracting 4<sup>2222</sup>, we get:

$$\begin{split} E_2 &= 3^{5555} + 4^{2222} + 5555^{2222} - 4^{2222} \\ &= (243)^{1111} + (16)^{1111} + (5555)^{2222} - 4^{2222} \end{split}$$

Again  $(243)^{1111} + 16^{1111}$  and  $(5555)^{2222} - 4^{2222}$  are divisible by 7

(:  $x^n + a^n$  is divisible by x + a when n is odd)

Hence  $2222^{5555} + 5555^{2222}$  is divisible by 7.

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{1.2}x^2 + \frac{n(n-1)(n-2)}{1.2.3}x^3.....$$

If x < 1, the terms of the above expansion go on decreasing and if x be very small, a stage may be reached when we may neglect the terms containing higher powers of x in the expansion. Thus, if x be so small that its square and higher powers may be neglected then  $(1 + x)^n = 1 + nx$ , approximately. This is an approximate value of  $(1 + x)^n$
